COGS RESOURCE CORRIDORS

(CRC) Master Strategy and Governance Document

Version 1.0 · Issued 25 April 2026

Umbrella document for all Foundation Member-benefit programmes

The unified governance structure for the Foundation's Member-benefit programmes across Communications, Energy, and Transport and Freight, operating on a common cryptographic resource management substrate.

Governing Law: South Australia, Australia

Drake Village, NSW 2469 · Wahlubal Country, Bundjalung Nation

PART 1 — PURPOSE AND NAMING

1. Purpose

1.1 This document is the umbrella strategy and governance reference for all Member-benefit programmes operated by the COGS of Australia Foundation. It defines the structural relationship between the Foundation's individual programmes, the common substrate on which they all operate, and the three operational branches under which they are grouped. It is the authoritative reference for how new programmes are designed, how existing programmes relate to one another, and how cross-branch integrations are governed.

1.2 The Foundation's Member-benefit programmes are collectively named COGS Resource Corridors (CRC). Each programme sits in one of three branches: Communications, Energy, or Transport and Freight. The name reflects the operational reality: these programmes are pathways along which resources flow to and between Members across Country, delivered through a common cryptographic management substrate that connects them all.

1.3 This document does not replace or supersede the individual programme planning and strategy documents. Those documents remain authoritative for their programme-specific scope, commercial model, regulatory posture, and platform build. This document sits above them and governs the structural relationship, the shared substrate, and the cross-branch integrations.

2. Naming — Corridors now, Songlines preferred with consent

2.1 The Foundation's preferred long-term name for this umbrella framework is "Community and Country Resource Songlines". Songlines in Aboriginal tradition are the ancient knowledge pathways that connect Country across the continent — trade routes, cultural passports, navigational systems, and living maps of community relationship and obligation. The parallel to what the Foundation is building through its Member-benefit programmes is deliberate: resources flowing along pathways that connect Members across Country, governed with custodianship and protocol, carrying both material and community-relationship value.

2.2 The Foundation will not adopt the Songlines name without the explicit, informed concurrence of the First Nations Advisory Council (FNAC), the Jubullum Local Aboriginal Land Council (JLALC), and Wahlubal Elders. Songlines are a living cultural and spiritual framework of First Nations peoples. They are not a metaphor for the Foundation to claim. Adopting the name without genuine concurrence would be appropriation, not partnership. Seeking concurrence requires a substantive cultural consultation that takes the time it takes — the Foundation is not in a position to shortcut that process, and does not attempt to.

2.3 Pending that consultation, the Foundation uses the working name "COGS Resource Corridors" (CRC). Corridors carries the relevant meaning — connected pathways along which people, goods, and knowledge move across Country — without borrowing from First Nations tradition. It is a neutral-origin word used in Australian land management, ecology, and freight contexts, and it stands on its own merit as a programme name.

The consent pathway

The Foundation's approach to the Songlines name is to seek concurrence through proper cultural-consultation channels, accept whatever answer is given, and adapt accordingly. Concurrence is not assumed. A declined concurrence is not a defeat; it is an answer that the Foundation respects. A

conditional concurrence (for instance, consent for use in certain contexts but not others) is implemented faithfully. The CRC name is operational-ready today and remains the Foundation's name for the framework until and unless concurrence is given. This is described fully in §29.

2.4 Code names, database identifiers, Godley account keys, platform module paths, and any other engineering or accounting identifiers use the "corridors" / "CORRIDORS" string regardless of the eventual branding decision. The reason is simple: engineering identifiers do not change when branding changes. The CRC naming at the code layer is permanent; the Songlines naming (if and when adopted) applies at the public, member-facing, and narrative layer only.

3. Scope

3.1 CRC covers all of the Foundation's Member-benefit service programmes — existing and future. As of the date of this document, four programmes are in planning or early operation under the CRC umbrella:

Programme	Branch	Status
Corridors Communications (mobile + NBN + data + voice, via PWN)	Communications	Planning and Strategy v1.1
Corridors Energy: Electricity (via Localvolts)	Energy	Planning and Strategy v1.1
Corridors Energy: LPG (via Supagas)	Energy	Planning and Strategy v1.1
Corridors Transport and Freight (Rides + Freight, Foundation as BSP)	Transport and Freight	Planning and Strategy v1.1 (Draft pending FNAC concurrence on Songlines naming at transport level)

3.2 Future programmes — whether within an existing branch or establishing a new programme class — are added to the CRC umbrella by Caretaker Trustee decision record with FNAC concurrence where First Nations governance or Sub-Trust C is engaged. Examples of candidate future programmes by branch are set out in §11.

3.3 This document is not a legal instrument. It does not override the Joint Venture Participation Agreement, the CJVM Hybrid Trust Declaration, or any Sub-Trust Deed. Where any provision of this document is inconsistent with a supreme instrument on close reading, the supreme instrument prevails and this document is taken to be amended to conform.

4. Relationship to the Foundation's governance documents

4.1 The CRC framework sits in a specific place in the Foundation's document hierarchy:

Layer	Documents
Supreme instruments	Joint Venture Participation Agreement (JVPA); CJVM Hybrid Trust Declaration; Sub-Trust Deeds A, B, and C
Foundation operating specifications	Godley Accounting Specification v1.0; Trustee Records

Layer	Documents
	System Plan and Strategy v1.0; Geofencing and Location Eligibility Specification
CRC umbrella (this document)	COGS Resource Corridors Master Strategy and Governance v1.0
Branch-level framing	(Implicit in this document — no separate branch-level documents)
Programme planning and strategy	Corridors Communications v1.1; Corridors Energy: Electricity v1.1; Corridors Energy: LPG v1.1; Corridors Transport and Freight v1.1
Partner-specific commercial	Localvolts Partnership Concept Note v1.0; (future) PWN, Supagas, and BSP concept notes as applicable

4.2 Each layer references the layer above for authority and is referenced by the layer below for context. The CRC document references the Foundation operating specifications for substrate conventions and references the supreme instruments for governance authority. It is referenced by each programme planning document as the source of branch placement and shared-substrate patterns.

PART 2 — THE THREE BRANCHES

5. Why three branches

5.1 The Foundation's Member-benefit programmes group naturally into three operational families. The grouping is not arbitrary: each branch has a distinct regulatory environment, a distinct commercial counterparty pattern, a distinct operational risk profile, and a distinct set of reporting and compliance obligations. Grouping programmes by branch allows the Foundation to apply consistent governance to programmes that share operational DNA, without forcing a single framework onto programmes that have genuinely different shapes.

5.2 The three branches are summarised in §6. Each branch is described in detail in §7–9. Cross-branch integrations are described in Part 4.

6. The three branches at a glance

Branch	What flows	Regulatory family
Communications	Voice, messaging, data, internet connectivity	Telecommunications (TIO, ACMA, IPND, TCP Code, Part 13 privacy, telecommunications metadata retention)
Energy	Electricity, gas, future energy carriers (hydrogen, renewable fuels)	Energy retail (NERL / AER, state energy regulators, ombudsman schemes, dangerous-goods regimes for LPG)
Transport and Freight	People, goods, vehicles, physical movement across Country	Point-to-point transport (state-by-state BSP authorisation), Heavy Vehicle National Law, Chain of Responsibility, Fair Work employee-like worker standards, rideshare GST

6.1 Each branch sits on the common substrate described in Part 3. The substrate carries the elements that are identical across branches — Member identity, COG$ mechanics, Sub-Trust C three-tier pattern, Godley ledger, evidence vault, FNAC governance — so that the branch-level and programme-level material can focus on what is genuinely distinct.

7. Communications branch

7.1 Purpose: connect Members to one another, to the Foundation, and to the wider digital world on terms that respect their autonomy and community context. Remove connectivity exclusion as a barrier to participation in the Foundation and in Australian life more broadly.

7.2 Current programmes: Corridors Communications (mobile + NBN + data + voice via PWN, with the Foundation as the Carriage Service Provider on the Member contract). Soft launch targeted Q4 2026 in the Jubullum / Drake / Tabulam pilot cohort, NSW-wide thereafter.

7.3 Branch-specific governance: TIO membership, ACMA CSP registration, IPND submission, TCP Code compliance, Part 13 privacy obligations, and metadata retention. These obligations sit with the

Foundation (not with a partner) because the Foundation is the CSP. The largest regulatory perimeter in the Communications branch.

7.4 Candidate future programmes: community radio or podcast distribution on Foundation-managed infrastructure; Internet of Things (IoT) connectivity for Member-owned devices (agricultural sensors, home energy monitoring); Unified Communications (UC7) for Member businesses.

8. Energy branch

8.1 Purpose: reliable, affordable, increasingly renewable energy supply to Members, with particular emphasis on regional and First Nations communities where supply is often more expensive and less reliable than in metropolitan Australia. Sub-Trust C eligibility makes the programme genuinely accessible for the Members who need it most.

8.2 Current programmes: two, on distinct partner models:

- **Corridors Energy: Electricity.** Delivered via Localvolts Pty Ltd (an AER-authorised peer-to-peer electricity retailer). Each Member contracts directly with Localvolts; the Foundation operates an AI optimisation and community-services overlay on top of the Localvolts API. Member-retailer contract is bilateral; Foundation is not on the retail contract.
- **Corridors Energy: LPG.** Delivered via a Foundation-held wholesale account with Supagas Pty Ltd. Member orders aggregate through the Foundation and deliver to community collection points or (via Transport/Freight branch last-mile integration) direct to Member premises. Foundation is on the commercial account.

8.3 Branch-specific governance: NERL / AER posture (held by Localvolts on electricity); dangerous-goods handling (held by Supagas on LPG); Energy and Water Ombudsman framework (Localvolts-held); ATO private ruling consideration on the 15% COG$ services fee flow-through, common to both programmes. Lighter direct regulatory perimeter than Communications because authorised partners carry the heaviest obligations.

8.4 Candidate future programmes: community-scale renewable generation on Country with FPIC (explicitly Phase 7+ in the Electricity programme); community battery and virtual power plant aggregation; petrol and diesel wholesale-account aggregation for Member vehicles (parallel structure to LPG); renewable fuel or green hydrogen aggregation as markets mature.

9. Transport and Freight branch

9.1 Purpose: reliable, fair, community-operated movement of Members and goods across Country. Close the distance barrier for regional Members. Coordinate last-mile delivery for other Foundation programmes (LPG today; other physical-goods programmes in future). Provide a community-operated alternative to commercial rideshare and freight services, on terms that are fair to driver-Members and operator-Members.

9.2 Current programmes: one programme with two distinct sub-interfaces:

- **Corridors Rides.** Personal transport and small-item delivery, Uber-style fast map-first flow. Vehicles with 12 seats or less.
- **Corridors Freight.** Goods movement over approximately 1 tonne, specialised vehicles, load-handling support, post-and-quote flow. Includes last-mile LPG delivery coordination for the Energy branch.

9.3 Branch-specific governance: NSW Booking Service Provider authorisation (held by the Foundation, 10-year authorisation, Safety Management System, Passenger Service Levy); Heavy Vehicle National Law and Chain of Responsibility for heavy-vehicle freight; Fair Work Closing Loopholes Act employee-like worker standards (voluntarily adopted ahead of formal orders); rideshare-driver GST registration obligations; dangerous-goods handling overlay for LPG last-mile work. The heaviest direct regulatory perimeter of any Foundation branch.

9.4 Candidate future programmes: community bus services (vehicles with more than 12 seats, different regulatory regime); community agricultural delivery aggregation; community fleet management services for shared vehicles or future generation-project assets.

10. What is not a branch

10.1 Some Foundation activities that might superficially resemble Member-benefit programmes are explicitly not CRC branches and sit under different governance:

- **Core governance activities** — Member polls, Trustee decisions, FNAC operation, Sub-Trust A, B, C operational management. These are governance, not Member-benefit programmes. Governed by the supreme instruments and the Trustee Records System.
- **ASX stewardship activities** — acquisition and custodianship of ASX-listed resource company shareholdings. Core to Foundation purpose, not a Member-benefit programme.
- **RWA token issuance** — in-ground mineral recognition through Real World Asset tokens. Core to Foundation purpose, governed by the JVPA and Declaration.
- **First Nations community partnership projects** — such as Sovereign Node hosting at Jubullum. Foundation-level First Nations partnership, governed through FNAC and JLALC, not a CRC branch.

10.2 The distinction matters for Sub-Trust C funding flows. Sub-Trust C funds CRC Supported-tier services to Members (CRC branch activity). Sub-Trust C also funds First Nations community programs and grants (governance / partnership activity). Both are legitimate Sub-Trust C applications; neither is within the other. The 30% minimum First Nations allocation under cl.27.3(d) is tracked across both.

11. Candidate future programmes

11.1 The following are not current programmes, not committed scope, and not in this document's authoritative ambit. They are listed to help the Foundation place future decisions within the branch structure:

Branch	Candidate future programmes
Communications	Community radio / podcast distribution; IoT connectivity for Member-owned devices; UC7 for Member businesses; future satellite broadband aggregation.
Energy	Community-scale renewable generation (with FPIC); community battery and VPP aggregation; petrol/diesel wholesale aggregation; renewable fuel aggregation; reticulated LPG for shared facilities.
Transport and Freight	Community bus services; agricultural delivery aggregation; community fleet management; last-mile for future Foundation-coordinated physical-goods programmes.

11.2 Before any candidate programme is committed, it goes through the same Phase 0 discipline applied to existing programmes: Trustee decision record; FNAC concept engagement; legal review; tax and AML review; insurance review; regulatory-framework scoping; community information briefings. The CRC substrate allows the shared elements to be reused, but no Phase 0 item is skipped.

PART 3 — THE COMMON SUBSTRATE

12. Why a common substrate

12.1 Every CRC programme, regardless of branch, operates on the same foundation-wide elements: the same Member identity, the same COG$ tokens and Sub-Trust accounting, the same Godley ledger discipline, the same evidence vault anchoring, the same First Nations governance pathway, and the same cryptographic identity and execution infrastructure. These elements are the substrate. They are defined once here and referenced by every programme document, rather than restated in each.

12.2 The substrate is the reason the Foundation can run four programmes (with more to come) without operational fragmentation. A Member who joins the Foundation, completes KYC, and establishes a COG$ balance does not need to repeat any of that to access any programme in any branch. A driver Member in the Transport and Freight branch uses the same cryptographic identity as an electricity Member in the Energy branch and a mobile Member in the Communications branch. Cross-branch integrations (LPG-to-Transport last-mile, for example) work because the substrate is shared.

13. Substrate element 1 — Member identity and KYC

13.1 Every Member of the Foundation has a cryptographic identity established at Foundation joining: KYC completed, Member record held in the Foundation database, soulbound identity NFT issued. Every CRC programme uses this single Member identity for onboarding, service consent, tier determination, billing, COG$ settlement, and Sub-Trust C eligibility.

13.2 A Member adding a second CRC programme does not repeat KYC. The Foundation's existing Member KYC covers all CRC programmes under the AML/CTF framework, with programme-specific identity overlays added where required by law (SIM identity check for pre-paid mobile; driver authority and licence verification for Transport driver Members). These overlays are additive to the Foundation KYC baseline, not replacements for it.

13.3 Member consent is captured programme-by-programme and is revocable programme-by-programme. Joining the Foundation does not auto-enrol a Member in any CRC programme. Each programme's onboarding flow asks explicit consent for that programme's terms, data handling, and financial flows.

14. Substrate element 2 — COG$ tokens and the 15% services fee

14.1 COG$ is the Foundation's cryptographic governance token family. The relevant CRC mechanics work across every programme:

- **Class C Community COG$** is the working token class for Member-benefit programmes. Members earn Class C COG$ through Foundation-approved earning mechanisms (including driver/operator Class C earnings in the Transport and Freight branch) and burn Class C COG$ against services fees.
- **The 15% COG$ services fee** is the standard Foundation fee across Energy and Communications programmes, calculated on the AUD total of the Member's bill or invoice for the period. Characterised as a retail services margin and infrastructure-testing nominal value. Transport and Freight applies a modified structure (fixed-per-transaction plus percentage) to suit the many-small-transactions shape of that branch, but the characterisation is the same.
- **Flow-through via Sub-Trust C** is the Foundation's established treatment: 15% COG$ services-fee income flows through Sub-Trust C as community infrastructure support and

capability-building, with ATO confirmation sought in Phase 0 of each programme (typically via private ruling application).

- **Class C offset caps** are Board-approved per-Member monthly and rolling 12-month limits that protect Members from unintentional over-burn and protect the Foundation from runaway burn during demand spikes. Cap values are set per programme but follow a consistent methodology.

15. Substrate element 3 — Sub-Trust C and the three-tier pattern

15.1 Every CRC programme operates on the same three-tier pattern:

Tier	Description
Community Basic	Member pays full AUD cost of service; pays COG$ services fee to Foundation; modest Class C offset permitted against services fee. Primary experience for Members who do not need subsidised service.
Community Standard	Member pays full AUD cost; pays COG$ services fee; larger Class C offset available; may receive priority features (priority dispatch in Transport, priority provisioning in Communications, etc.). Middle experience.
Community Supported	Sub-Trust C funds the AUD cost up to a per-Member cap; COG$ services fee drawn from Class C balance or waived. Eligible Members: First Nations Members; concession card holders; Pay It Forward recipients; persons under state care. The tier where the Foundation's redistributive mission is operationally expressed.

15.2 Supported-tier eligibility is determined at Member onboarding and reviewed annually, with programme-level fine-tuning (for example, priority for essential journeys in Transport; priority for home connectivity in Communications). The eligibility criteria are consistent across programmes because they are an expression of the Foundation's Sub-Trust C purpose, not programme-specific product features.

15.3 The 30% minimum First Nations allocation under cl.27.3(d) applies across all CRC programmes combined, not per programme. Programmes that deliver disproportionately to First Nations Members (Transport last-mile in Jubullum, for example) count strongly toward the 30% numerator; all CRC Supported-tier spending counts in the denominator. Annual FNAC reporting reconciles this across the whole CRC framework.

16. Substrate element 4 — Godley ledger

16.1 Every CRC programme's financial flows are recorded in the Foundation's double-entry Godley ledger as specified in the Godley Accounting Specification v1.0. Programme-specific account keys follow a consistent naming convention:

Account key pattern	Purpose
CORRIDORS-{BRANCH}-{PROGRAMME}-AR	Accounts receivable — COG$ services fees invoiced but not yet settled.
CORRIDORS-{BRANCH}-{PROGRAMME}-REV	Revenue — COG$ services fees settled.

Account key pattern	Purpose
CORRIDORS-{BRANCH}-{PROGRAMME}-AP	Accounts payable — partner invoices payable in AUD (where applicable).
CORRIDORS-{BRANCH}-{PROGRAMME}-SUBSIDY	Expense — Sub-Trust C AUD paid on behalf of Supported-tier Members.
CORRIDORS-{BRANCH}-{PROGRAMME}-OFFSET-CLEARING	Clearing — Class C offsets applied to services-fee invoices.

16.2 For continuity with engineering work already commenced, the existing `COMMUNITY-*` prefix is retained at the account-key level and the `CORRIDORS-*` prefix is introduced as the authoritative pattern for new programmes. A schema migration aligning existing keys to the `CORRIDORS-*` pattern may be executed at any point the Caretaker Trustee determines the cost of migration is justified; the migration is a clean key-rename with a single SQL deploy per programme. The branch and programme identifier in the account key allows fleet-wide reporting by branch without restructuring the ledger.

16.3 All Godley invariants defined in the Godley Accounting Specification v1.0 apply to CRC programmes. No invariants are relaxed for any CRC programme. Programme-specific invariants (such as per-Member monthly Sub-Trust C draw caps) are additive.

17. Substrate element 5 — evidence vault anchoring

17.1 Every material event in every CRC programme is anchored to the Foundation's evidence vault with SHA-256 content hashing, establishing an auditable cryptographic record. Anchored event classes include, at minimum: Member consent grant or revocation; service activation or deactivation; bill or invoice issuance; payment settlement; subsidy disbursement; services-fee settlement; Class C burn or earning; incident or safety event; governance decisions affecting the programme.

17.2 The evidence vault operates on the same cryptographic primitives as the Foundation's execution-service architecture (one-time tokens, SHA-256 canonicalised payloads, and Hyperledger Besu commitment on migration). Anchoring records are content hashes only; no Member-identifiable content is published on-chain. Members retain privacy while the Foundation retains integrity.

17.3 This cryptographic resource management system is what the Foundation refers to when it says "the COGS proprietary cryptographic resource management system". It is not a claim to novel cryptography — SHA-256, soulbound NFTs, one-time tokens, and permissioned blockchain commitment are all established primitives. The proprietary aspect is the way these primitives are combined and governed under the JVPA, the Declaration, and the Sub-Trust Deeds, to produce an auditable resource-flow record that sits under Member governance, FNAC oversight, and entrenched constitutional protection.

18. Substrate element 6 — FNAC governance

18.1 Every CRC programme has First Nations governance built into its structure from Phase 0. The common elements:

- **FNAC concept engagement** before programme launch, with written FNAC response on file.
- **JLALC liaison** for any programme operating in the Jubullum / Drake / Tabulam pilot cohort, with specific attention to how the programme affects First Nations Members in those communities.

- **30% First Nations allocation tracking** across all CRC Sub-Trust C flows, reported to FNAC annually.
- **FPIC requirement** for any geographic extension of a CRC programme onto a new First Nations Country.
- **Elder consultation** for any programme where cultural content, cultural-site awareness, or cultural protocols are surfaced through the programme interface.

18.2 FNAC concurrence on the Songlines naming at umbrella and transport-branch level sits alongside these elements, not in place of them. FNAC endorsement is not a one-time formality but a standing relationship that persists through every phase of every programme.

19. Substrate element 7 — cross-hub governance

19.1 Every CRC programme is referenced in each of the Foundation's five governance hubs:

Hub	Common CRC touchpoint
First Nations JV	FNAC endorsement; JLALC liaison; 30% allocation monitoring; FPIC for geographic extension; Elder consultation where cultural content is involved.
Financial Oversight	Partner or counterparty reconciliation; Sub-Trust C draw monitoring; 15% services-fee run; Class C offset reporting; monthly programme financial reporting; cross-programme treasury view.
Day-to-Day Operations	Partner relationship management; complaints-pathway management (programme-specific ombudsman where applicable); incident response; Member support runbook.
Technology and Blockchain	Programme Member and admin modules; partner or platform API integration; evidence-vault anchoring; Hyperledger Besu migration readiness; cryptographic identity and execution.
Place-Based Decisions	Community-level coordination; community information briefings; place-specific adaptations (Drake, Tabulam, Jubullum; future communities by FPIC).

19.2 Each programme's own planning and strategy document specifies the programme-specific hub touchpoints (for example, Electricity has the AI optimisation telemetry review in the Technology hub; Transport has the BSP compliance calendar in the Day-to-Day Operations hub). Programme-specific touchpoints sit alongside the common ones, not in place of them.

20. Substrate element 8 — Phase 0 discipline

20.1 Every CRC programme follows a structured Phase 0 readiness process before commencement. The checklist varies by programme (Transport has 14 items; LPG has 9) but the underlying pattern is identical and reflects the substrate:

- Trustee decision record authorising scope.
- FNAC concept engagement; JLALC briefing where applicable.

- Legal review of regulatory posture and any programme-specific characterisations (such as fee treatment).
- Tax advice and, where warranted, ATO private ruling application.
- AML/CTF review covering the programme's specific financial and identity flows.
- Insurance review appropriate to the programme's risk profile.
- Partner engagement (where the programme is partner-delivered).
- Regulatory authorisation work (where the Foundation itself holds the authorisation).
- Community information briefings.
- Phase 0 closure decision record.

20.2 Phase 0 is the single greatest determinant of programme success. The CRC umbrella does not shortcut Phase 0 for any programme. The substrate allows shared elements (existing Member KYC, existing Godley framework, existing evidence vault) to be leveraged; it does not allow the programme-specific Phase 0 items to be skipped.

PART 4 — CROSS-BRANCH INTEGRATIONS

21. Why cross-branch integrations matter

21.1 The three branches are not silos. The substrate they share — Member identity, COG$, Sub-Trust C, Godley ledger, evidence vault — is precisely what allows programmes in different branches to interoperate without bespoke integration work. Cross-branch integration is the place where the CRC umbrella structure delivers operational value beyond the sum of the individual programmes.

21.2 Three integrations are documented in this Part. The first (Energy LPG ↔ Transport Freight last-mile) is already structurally committed in the existing programme documents. The second (Energy ↔ Transport via vehicle operating cost) is recognised in the existing documents but not yet operationalised. The third (Communications ↔ all branches via platform connectivity) is foundational rather than programme-specific. Future cross-branch integrations are added to this Part as they emerge; the Part is not exhaustive of long-term possibilities.

22. Integration 1 — LPG last-mile via Transport Freight

22.1 The Energy branch's LPG programme produces a delivery gap by design: Supagas delivers cylinders in bulk to community collection points (Drake Village Resource Centre, Tabulam community centre, JLALC-designated points at Jubullum) on scheduled delivery days. Members who cannot get to the collection point on the delivery day need a last-mile delivery service. The Transport and Freight branch closes that gap.

22.2 Operational flow:

- **LPG Member places order** in the Energy LPG module, indicating delivery preference (self-collection at the community collection point, or last-mile delivery to Member premises).
- **Supagas delivers in bulk** to the community collection point on the scheduled day.
- **For last-mile-required orders,** the Transport Freight module automatically posts a last-mile job from the collection point to the Member premises, in the appropriate vehicle class with the LPG-handling specification, scheduled within 48 hours of the bulk delivery.
- **An LPG-certified Member operator accepts the job** (only operators with the LPG-certified flag in their Transport profile can accept LPG jobs). The operator collects the Member's cylinder(s) at the collection point and delivers to the Member's premises.
- **Consignment chain closes** only when the Member confirms receipt of the cylinder. The evidence vault holds a single linked record covering the LPG order, the Supagas bulk delivery, and the Transport Freight last-mile delivery. Sub-Trust C funding for Supported-tier Members covers both the Supagas cylinder cost and the Transport Freight delivery cost.

23. Integration 1 — governance and compliance handling

23.1 Cross-branch integration introduces governance considerations that neither branch alone fully addresses. The integration is governed by a short Operational Agreement maintained between the Energy and Transport and Freight branches, signed at programme-coordinator level and reviewed annually. Specific elements:

- **LPG-certified operator pool.** Only operators with documented dangerous-goods training (delivered through Supagas or an equivalent recognised training provider) and the

corresponding flag in their Transport profile can accept LPG jobs. Foundation verifies certification at onboarding and annually thereafter.

- **Vehicle class restrictions.** LPG cylinders must be transported in ute trays, vans with cargo separation, or trailers. Not in passenger compartments of cars. The Transport Freight job-posting flow enforces this at job creation.
- **Handling protocol.** Upright orientation, secured against movement, valve closed and capped, ventilated transport space, no smoking. Operator confirms protocol acknowledgement at job acceptance.
- **Short-route delivery.** Last-mile only. Multi-day or interstate transport of LPG remains out of CRC scope.
- **Insurance.** Operator vehicle insurance must include dangerous-goods coverage at the relevant level. The Foundation's contingent cover applies as a backstop.
- **Pricing.** LPG last-mile is priced as a Transport Freight job (per-job base + per-km + handling) plus a fixed LPG-handling surcharge per cylinder. The COG$ services fee applies once, on the last-mile transaction. The Energy LPG services fee on the cylinder cost applies separately.

24. Integration 2 — Energy and Transport via vehicle operating cost

24.1 The Transport and Freight branch sets per-kilometre rates that reflect driver/operator vehicle operating cost. Vehicle operating cost is dominated by fuel, which sits in the Energy branch. There is a structural opportunity for direct integration once the Energy branch matures:

- **Fuel as Energy programme.** If the Energy branch adds petrol/diesel wholesale aggregation (a candidate future programme noted in §8.4), Member driver/operators in the Transport branch could fuel their vehicles through the Foundation's wholesale account, with the same Sub-Trust C three-tier overlay and the same COG$ services-fee mechanic. Driver operating cost falls; rider/consignor AUD fares fall; Class C earning per trip remains.
- **EV charging.** Energy branch electricity supply for Member EV charging is already structurally available through the existing Localvolts partnership. A Member driver with a home EV charger and a Localvolts contract is already getting their EV charging costs through the Energy Electricity programme. Integration is implicit, not bespoke.
- **Future generation ↔ fleet.** If the Energy branch eventually delivers a community-scale renewable generation programme, surplus generation could prioritise charging Foundation Member EV fleet vehicles. This is long-horizon and listed for completeness.

24.2 None of these are committed Phase 1 scope. They are listed because the umbrella structure makes them tractable when the time comes. Without the umbrella structure, each would require bespoke partnership renegotiation.

25. Integration 3 — Communications as platform connectivity

25.1 Every CRC programme delivers Member experience through the Foundation platform, and Member access to that platform requires connectivity. The Communications branch therefore underpins every other programme operationally. This is not so much an integration as a structural prerequisite, but it deserves explicit acknowledgement:

- **Member access to the Foundation platform** depends on connectivity. A Supported-tier Communications service to a Jubullum Member is also the access path to that Member's Energy, Transport, and Foundation governance interfaces.

- **IoT in Energy.** Future Energy programmes that involve home energy monitoring or smart-home device control require IoT connectivity. PWN's wholesale IoT capability under the Communications branch is the natural delivery channel.
- **Transport on-vehicle connectivity.** Driver and operator devices use the Foundation platform during trips and jobs. SIM provisioning for driver/operator Member devices flows from the Communications branch — a Member who is also a Transport driver could receive a Communications Standard tier SIM as a tool-of-trade allocation, with COG$ flow handled accordingly.

25.2 These integrations are foundational; the Communications branch carries the connectivity, every other branch consumes it. The CRC umbrella allows this to be governed once at the substrate level rather than negotiated separately for each programme.

26. Cross-branch financial flow consistency

26.1 The Foundation's Godley ledger is structurally consistent across branches and supports cross-branch financial flow without bespoke reconciliation. A worked example for an LPG last-mile delivery to a Supported-tier Member:

Sector	Flow	Branch
STC-OPERATING	− (cylinder AUD + last-mile AUD)	Sub-Trust C
CORRIDORS-ENERGY-LPG-SUBSIDY	+ (cylinder AUD)	Energy branch
CORRIDORS-TRANSPORT-FREIGHT-SUBSIDY	+ (last-mile AUD)	Transport and Freight branch
EXTERNAL-VENDOR (Supagas)	+ (cylinder AUD)	Energy branch counterparty
MEMBER (operator)	+ (last-mile AUD)	Transport and Freight Member
CORRIDORS-TRANSPORT-FREIGHT-AR	+ (15% COG$ services fee on last-mile)	Transport and Freight COG$
CORRIDORS-ENERGY-LPG-AR	+ (15% COG$ services fee on cylinder cost)	Energy COG$
ROW SUM	0	(double-entry integrity preserved)

26.2 The same Member is debited (or, for Supported tier, has Sub-Trust C as the substitute payer) for both legs through a single coordinated flow. The Member sees one delivered cylinder; the ledger sees two distinct branch-tagged transactions; the substrate makes this trivial. Cross-branch reconciliation is reporting, not operational complexity.

PART 5 — FUTURE PROGRAMME PLACEMENT FRAMEWORK

27. How a new programme is placed in CRC

27.1 When the Foundation considers a new Member-benefit programme, the placement decision — which branch, what relationship to existing programmes, what cross-branch integration potential — is made through a structured assessment. The framework is designed to be applicable consistently regardless of who is making the decision and at what stage of the Foundation's development.

28. Placement assessment questions

28.1 The Caretaker Trustee (or, post-Expansion, the Board) assesses each candidate programme against the following questions before issuing a Phase 0 authorising decision record:

#	Question	What the answer determines
1	What flows along this programme — connectivity, energy, physical movement, or something else?	Branch placement (Communications / Energy / Transport and Freight / new branch)
2	Does the programme fit the regulatory family of the candidate branch?	Whether the existing branch governance applies cleanly or whether new governance work is needed
3	Is the Foundation directly regulated, or does a partner hold the primary regulatory burden?	The shape of the partner relationship and the depth of Foundation operational responsibility
4	Does the programme use the standard 15% COG$ services-fee mechanic, or does its transaction shape require an adapted structure?	The COG$ flow design within the substrate
5	Does the programme rely on Sub-Trust C funding for any tier, and does it interact with the 30% First Nations allocation?	FNAC engagement intensity; Sub-Trust C draw cap implications
6	Does the programme integrate with one or more existing programmes?	Cross-branch integration design; whether existing programme documents need updating
7	Does the programme require a new Sub-Trust D (or similar new structural element) under the Foundation's governance documents?	Whether JVPA / Declaration / Sub-Trust amendment is required (a Special Resolution gate)
8	Does the programme require a new community-information	Phase 0 community briefing scope

#	Question	What the answer determines
	briefing programme, or is it within scope of existing engagement?	
9	Does the programme establish a new partner relationship, or extend an existing one?	Phase 0 partner engagement scope
10	Does the programme require a new regulatory authorisation held by the Foundation itself?	Phase 0 authorisation work; capability and resourcing requirement

29. When a candidate programme creates a new branch

29.1 The three current branches reflect the structure of the Foundation's Member-benefit programmes today. They are not a closed set. A future Member-benefit programme that does not fit any existing branch creates a candidate fourth branch. The framework for adding a new branch:

- **Caretaker Trustee determination** (or post-Expansion Board determination by Special Resolution where the JVPA so requires) that a new branch is warranted by structural difference, not by preference for taxonomic neatness.
- **FNAC concurrence** on the new branch, with specific attention to whether the new branch has First Nations governance implications distinct from the three existing branches.
- **Naming consistent with the umbrella.** If the umbrella name is still Corridors at the time, the new branch follows the Corridors naming pattern. If the umbrella has moved to Songlines (with FNAC concurrence), the new branch naming follows that pattern.
- **Branch-specific governance scoping** documented in this CRC document by amendment, with the new branch added to the section structure and referenced from Phase 0 of any programme placed in it.

29.2 The Foundation does not multiply branches for bureaucratic convenience. A new branch is created when the regulatory family, commercial counterparty pattern, operational risk profile, and reporting and compliance obligations are genuinely different from any existing branch. A programme that fits an existing branch is placed in that branch even if it is operationally distinct from the other programmes already there.

30. Worked placement example — community bus services

30.1 If the Foundation considered launching a community bus service (vehicles with more than 12 seats, scheduled or on-demand routes for Members and community), the placement assessment runs:

- **What flows?** People — same fundamental flow as Corridors Rides, just with a different vehicle class. Branch placement: Transport and Freight.
- **Regulatory family fit?** Different from Rides at the regulatory layer — vehicles with more than 12 seats fall outside the NSW point-to-point regime and into bus-service authorisation. New branch governance work needed within the Transport branch, but not a new branch.
- **Direct regulation?** Foundation likely the operator under bus-service legislation, similar in structure to BSP authorisation but a different specific authorisation.
- **COG$ mechanic?** Per-passenger fare with COG$ services fee — same shape as Rides.

- **Sub-Trust C interaction?** Yes — community bus to medical appointments, ceremony, school transport for Jubullum Members would be Supported-tier candidate.
- **Cross-branch integration?** Possibly — community bus could carry small freight on regular routes (mail, supplies) under a hybrid model.

30.2 Placement: Transport and Freight branch, new programme. Branch-level governance work needed for bus authorisation. Substrate elements (Member identity, COG$, Sub-Trust C, Godley, evidence vault, FNAC) all reused. Phase 0 follows the standard pattern with bus-specific authorisation as a major gate.

PART 6 — DATABASE AND HUB RECORD STRUCTURE

31. Hub project records

31.1 The Foundation's community projects hub holds a record per Member-benefit programme. As of the date of this document, four programme records exist or are planned:

ID	Programme	Branch	Status
2	Community Mobile Phone Service → Corridors Communications	Communications	Existing record; rename to Corridors Communications applied via SQL update
TBD	Corridors Energy: Electricity	Energy	Record to be created on Phase 0 commencement
TBD	Corridors Energy: LPG	Energy	Record to be created on Phase 0 commencement
TBD	Corridors Transport and Freight	Transport and Freight	Record to be created on Phase 0 commencement (post FNAC concurrence on Songlines naming)

31.2 Database migrations to align with CRC structure are sequenced behind the Phase 0 closure decision record for each affected programme. The Foundation does not rename a hub record before its substantive Phase 0 work is complete; the rename and the launch happen as a single coordinated action.

32. Module path conventions

32.1 Member-facing and admin platform module paths follow the corridors_* / Corridors naming pattern:

Path	Programme
/services/corridors/communications/	Corridors Communications Member module
/services/corridors/energy/electricity/	Corridors Energy: Electricity Member module
/services/corridors/energy/lpg/	Corridors Energy: LPG Member module
/services/corridors/transport/rides/	Corridors Transport and Freight — Rides interface
/services/corridors/transport/freight/	Corridors Transport and Freight — Freight interface
/services/corridors/transport/operator/	Corridors Transport and Freight — driver/operator interface
/admin/corridors/	Admin module with branch sub-sections

32.2 Existing draft module paths (`/services/electricity/`, `/services/lpg/`, etc.) used in the prior versions of programme planning documents are superseded by the corridors_* convention. Where such paths

have already been seeded in code, they are migrated to the new pattern as part of the Phase 1 build for each programme. Where they have not yet been seeded, the new pattern applies from first commit.

33. Database table conventions

33.1 Programme-specific MariaDB tables follow the `corridors_{programme}_{purpose}` pattern:

Table pattern	Example
corridors_comms_*	corridors_comms_member_accounts, corridors_comms_services, corridors_comms_invoices, etc.
corridors_elec_*	corridors_elec_member_accounts, corridors_elec_intervals, corridors_elec_bills, etc.
corridors_lpg_*	corridors_lpg_member_accounts, corridors_lpg_orders, corridors_lpg_deliveries, etc.
corridors_transport_*	corridors_transport_driver_operators, corridors_transport_trips, corridors_transport_freight_jobs, etc.

33.2 Existing schema drafts (`electricity_*`, `lpg_*`, `comms_*`, `songlines_*`) are migrated to the corridors_* pattern as part of each programme's Phase 1 build. The migration is a straight `RENAME TABLE` per table with a single SQL deploy per programme, executed before any production data is written to the original-named tables. Foreign-key references (within the schema and across the existing Foundation schema) are updated in the same migration.

34. Godley account key alignment

34.1 Godley account keys for CRC programmes follow the CORRIDORS-{BRANCH}-{PROGRAMME}-{TYPE} pattern:

Pattern	Example keys
CORRIDORS-COMMS-*	CORRIDORS-COMMS-AR, CORRIDORS-COMMS-REV, CORRIDORS-COMMS-AP, CORRIDORS-COMMS-SUBSIDY, CORRIDORS-COMMS-OFFSET-CLEARING
CORRIDORS-ENERGY-ELEC-*	CORRIDORS-ENERGY-ELEC-AR, CORRIDORS-ENERGY-ELEC-REV, CORRIDORS-ENERGY-ELEC-AP-SUPPORTED, CORRIDORS-ENERGY-ELEC-SUBSIDY, CORRIDORS-ENERGY-ELEC-OFFSET-CLEARING
CORRIDORS-ENERGY-LPG-*	CORRIDORS-ENERGY-LPG-AR, CORRIDORS-ENERGY-LPG-REV, CORRIDORS-ENERGY-LPG-COST-PASSTHROUGH, CORRIDORS-ENERGY-LPG-SUBSIDY, CORRIDORS-ENERGY-LPG-OFFSET-CLEARING

Pattern	Example keys
CORRIDORS-TRANSPORT-*	CORRIDORS-TRANSPORT-AR, CORRIDORS-TRANSPORT-REV, CORRIDORS-TRANSPORT-PSL, CORRIDORS-TRANSPORT-SUBSIDY, CORRIDORS-TRANSPORT-DRIVER-EARNINGS-CLEARING, CORRIDORS-TRANSPORT-CLASS-C-EARNED, CORRIDORS-TRANSPORT-OFFSET-CLEARING

34.2 Existing keys drafted under the COMMUNITY-* prefix (`COMMUNITY-MOBILE-*`, `COMMUNITY-ELECTRICITY-*`, `COMMUNITY-LPG-*`, `COMMUNITY-COMMS-*`, `COMMUNITY-SONGLINES-*`) are aligned to the CORRIDORS-* pattern via stewardship_accounts key migration at each programme's Phase 4 (accounting integration) phase, executed before any Member-facing transaction settles to the relevant account. The migration is a straight `UPDATE stewardship_accounts SET account_key = ... WHERE account_key = ...` per key, with corresponding updates to ledger-entries foreign references in a single coordinated SQL deploy.

34.3 The corridors_* / CORRIDORS-* identifiers are permanent. They do not change if the umbrella name moves from Corridors to Songlines following FNAC concurrence. The reason is structural: engineering identifiers carry no public branding and changing them would force unnecessary migration. Public branding lives at the application and document layer.

PART 7 — PUBLIC-FACING EXPLAINER

35. Plain-language description for Members and the public

35.1 This section provides a plain-language explanation of CRC suitable for Member onboarding materials, community information briefings, the Foundation website, and the Black and White Paper. It is written to be lifted directly into those materials with light editing for context.

COGS Resource Corridors — the short version

COGS Resource Corridors (CRC) are the Foundation's community-services programmes. They are the practical ways your COGS Foundation membership delivers everyday value: connectivity to communicate with the world, energy to live and work, transport to move across Country and to send goods where they need to go. Three branches — Communications, Energy, and Transport and Freight — cover what most Members need most. Each branch has programmes you can take up individually, on your own terms, at your own pace.

Three things make CRC different from commercial services: First Nations governance is built in from the start, not added later; the Foundation does not extract a margin from your essential services — services are at cost or near-cost, with a small COG$ services fee that funds community infrastructure and capability-building; and a Supported tier is genuinely available to Members who need it, funded through Sub-Trust C, with a particular focus on First Nations Members under the Foundation's entrenched 30% allocation.

We don't make money from your phone bill, your power bill, your gas bottle, or your trip to the shops. We coordinate the partnerships, run the platform, do the cryptographic accounting that proves every dollar and every COG$ ends up where it should be, and pay for that work with a small services fee that flows straight back into community infrastructure. Your AUD goes to the partners — PWN, Localvolts, Supagas, the driver, the freight operator. Your services fee in COG$ goes to Sub-Trust C, which is the part of the Foundation set up to support community needs, with at least 30% by entrenched constitutional commitment going to First Nations community programs.

36. The three branches in plain language

Branch	What you get from it
Communications	Mobile, home internet, business data, voice. Everything from the SIM in your pocket to a fast NBN connection at home, run on a single Foundation-held wholesale partnership with PWN. One partner across all your communications needs.
Energy	Electricity at your premises, via Localvolts — a peer-to-peer retail partner with no markup, plus a Foundation-run AI helper that tells you when power is cheap or clean. LPG cylinders for cooking, heating, hot water, ordered through the Foundation's wholesale account with Supagas.
Transport and Freight	Lifts to where you need to go, delivery of goods, with rides for personal travel and freight for bigger jobs. Driver Members and operator Members earn the full fare — the Foundation takes no commission. LPG cylinders delivered to your door for free or near-free if you're on the Supported tier.

37. How the three tiers work in plain language

- **Community Basic.** You pay the AUD cost of your service in full, plus a 15% COG$ services fee to the Foundation. You can use Class C COG$ to offset the services fee within sensible monthly limits.
- **Community Standard.** Same as Basic, with priority on community delivery days and bigger Class C offset allowances.
- **Community Supported.** If you're a First Nations Member, a concession card holder, a Pay It Forward recipient, or under state care, the Foundation funds your AUD cost from Sub-Trust C. Your COG$ services fee is drawn from Class C or waived. You get the service at zero or near-zero net cost.

38. Naming — a note for Members

38.1 The Foundation's preferred name for this framework is Songlines, reflecting the ancient knowledge pathways that connect Country across Australia. We have not adopted that name. We will only adopt it if the First Nations Advisory Council, the Jubullum Local Aboriginal Land Council, and Wahlubal Elders give their concurrence after a proper cultural consultation. Songlines are sacred, and the Foundation does not appropriate. While that consultation is happening, we use Corridors. If concurrence is given, we move to Songlines. If concurrence is declined or limited, we stay with Corridors. Either way, the work is the same; the name reflects the relationship.

PART 8 — READINESS AND SIGNATURE

39. Readiness statement

39.1 This document, together with the four CRC programme planning and strategy documents at v1.1 (Corridors Communications, Corridors Energy: Electricity, Corridors Energy: LPG, Corridors Transport and Freight), the JVPA, the CJVM Hybrid Trust Declaration, the Sub-Trust Deeds A, B, and C, the Godley Accounting Specification v1.0, the Trustee Records System Plan and Strategy v1.0, and the Foundation's current platform source at repo cogsaustralia/Cog, constitutes the complete CRC operating reference.

39.2 This umbrella document does not initiate any operational activity by itself. Each programme's Phase 0 process remains the gating mechanism for that programme's commencement. The umbrella documents the structural relationship between programmes, the common substrate, and the cross-branch integration framework.

39.3 Amendments to this document are made by Caretaker Trustee decision record, with FNAC concurrence where the amendment affects First Nations governance, the Songlines naming question, or any element with structural implications across multiple programmes.

40. Confirmation items

40.1 Five items to confirm at the umbrella level:

- **Item A.** COGS Resource Corridors (CRC) is the Foundation's working name for the umbrella framework, with the corridors_* / CORRIDORS-* identifier conventions permanent at the engineering and accounting layer regardless of any future branding decision.
- **Item B.** Songlines is the Foundation's preferred long-term umbrella name, with adoption conditional on FNAC, JLALC, and Wahlubal Elder concurrence following a proper cultural consultation. Until and unless concurrence is given, the Songlines name is not used at the umbrella level.
- **Item C.** The three-branch structure (Communications, Energy, Transport and Freight) is the Foundation's programme classification framework, with new branches added only when structural difference warrants and with FNAC concurrence.
- **Item D.** The common substrate (Member identity, COG$, Sub-Trust C three-tier pattern, Godley ledger, evidence vault, FNAC governance, cross-hub pattern, Phase 0 discipline) applies to every CRC programme and is referenced by programme-level documents rather than restated in each.
- **Item E.** Cross-branch integrations (LPG ↔ Transport last-mile is the first; Energy ↔ Transport vehicle operating cost and Communications ↔ all branches platform connectivity are recognised; future integrations added by amendment) are governed at the umbrella level with operational coordination at branch-coordinator level.

41. Amendment history

Version	Date	Change
1.0	25 April 2026	Initial issue. Establishes COGS Resource Corridors (CRC) as the Foundation's umbrella framework, three-

Version	Date	Change
		branch structure (Communications, Energy, Transport and Freight), common substrate, cross-branch integration framework, future programme placement framework, and database/code/account conventions. Songlines naming flagged as preferred long-term subject to FNAC and JLALC concurrence.
